R&D TIP

What makes R&D work experimental

How core R&D activities are described

Swipe →

01

Core R&D is experimental

Under the R&D Tax Incentive, core R&D activities are experimental activities conducted to generate new knowledge.

02

The outcome cannot be known upfront

A competent professional could not work out the result in advance from current knowledge, information or experience.

03

The work follows a method

Core R&D follows a systematic progression of work: hypothesis, experiment, observation, evaluation and logical conclusions.

04

Experiments test the hypothesis

Records should show what was varied, what was held constant and what was measured.

05

Related experiments can group together

A series of experiments testing the same technical idea can form one core activity.

Pass it on

Share it with a developer or engineer who documents experimental work.
